Ecopol is a large coatings production company with 25 years of experience in industry. Our modernly equipped R&D laboratory supports the well-supplied manufacturing facilities in production process to achieve the highest quality of our products. The vast warehouses allow to store enough products to satisfy all our trading partners' demands and to have almost unlimited source of raw materials.

The openness and decency inside the company as well as in business relations lead to stability and confidence. As a result, Ecopol has a wide distribution network that makes our products available not only in Russia but also abroad, and the well-developed logistics system allows to quickly deliver nearly any amount of cargo all over the world.

Following the market development, Ecopol expands its activities in innovations and optimization of the production process. Company staff is attentive to any suggestions and is open for communication in order to optimize all of the business aspects.

Ecopol creates and successfully implements unique and modern products on the rapidly growing coatings market.

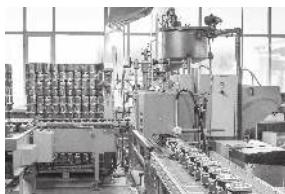

Refinishing products

Reoflex™ is a wide range of high-quality automotive refinishing products. It contains fillers, primers, putties, topcoats, aerosols and paint related products. All products are certified with ISO 9001 and comply with the European Directive for limitations VOC 2004/42/EC of the European Parliament and the Council, which guarantees the environmental safety.

Reoflex™ is a well-known automotive refinishing brand due to the price, quality and innovations.

Reoflex™ is widely recognized by consumers and is readily available because of the strong distribution network.

Refinishing results are not only depend on quality materials and perfect color matching, the proper preparation of the surface is essential. When all the stages of the refinishing process are made thoroughly in compliance with technological recommendations the good result must be achieved.

Metal surface treatment

Surface check

All automotive metal spare parts are sold with protective coating on them. The quality of this coating could be easily examined with 'Solvent test'. The moistened with aggressive solvent cloth should be put on the surface for several minutes and then the coating must be wiped down with the cloth, if there are stains of the protective coating on the cloth, this coating must be removed. When the cloth is clean, it means that the protective coating is of the high quality and it could be overpainted with no doubt.

Degreasing

It's the cleaning stage. The surface could be stained with different contaminants, so the proper degreasing is very important. Antisilicone Reoflex is the right choice. It could be applied with sprayer or by moisturizing of the cloth and then wiped out with the dry cloth from the surface.

Attention! Antisilicone Reoflex must be fully wiped out from the surface. Evaporation is not allowed.

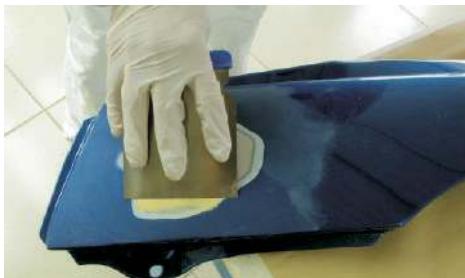

Sanding

To achieve the high quality of the topcoat the proper abrasive materials must be chosen. The sanding should be started with hard abrasives and then properly softened. Recommendations on abrasive materials are in the Table 1.

Table 1.

Surface	Before application	Dry sanding	Wet sanding
Putties	P240	P80-150-240	-
Polyester Stopper	P240	P150-240	-
Fillers-Surfacers	P240 or red sanding pad	P320-500	P600-1000*
Topcoats	P400 or grey sanding pad	-	-

*The surface must be dried before the overpainting.

Filling

The surface must be smooth before application of the topcoats and here's a wide range of the fillers, primers and surfacers to help with. Putties should be used to improve significant damages. Before application the putty must be mixed thoroughly with 2-3 mass % of hardener.

Attention! It's very important to ensure the mixing ratio. Exceeding of the hardener may cause defects of the topcoat while insufficient amount could lead to increased drying times and difficulties with sanding.

Then the putty should be applied on the properly treated surface with the thickness of the layer not more than 4 mm and cured at 20°C for 30 min.

Anticorrosive treatment

To avoid the corrosion process of the refinished metal parts it's necessary to apply the anticorrosive primer on the bare metal area of the refinishing surface. Drying times of the anticorrosive primers are available in the Table 2.

Table 2.

Anticorrosive primer	Drying time at 20°C
Washprimer CF	45 min
Washprimer CF 1+1	45 min
EP Primer	6-20 h or 30 min wet-on-wet

After this the primer-surfacer could be applied. Usually, the surfacers are applied with gravity guns (gun tip 1.6-1.8 mm, pressure 2-4 bar) in 2-3 layers with the total thickness of 130-250 microns. Flash-off between the layers at 20°C 10-15 min and drying time at 20°C 4-8 h, or the forced drying at 60°C 30 min. The surface must be sanded before overpainting.

*The usage of EP Primer simplifies the process because EP Primer is a good surfacer with high corrosion resistance.

Topcoats

Acrylic enamel

Acrylic enamels are usually applied with gravity guns (gun tip 1.3-1.5 mm, pressure 2-4 bar) in 2-3 layers with flash-off between the layers at 20°C 10 min. Drying time of the acrylic enamel is 16 h at 20°C or 30 min at 60°C (flash-off at 20°C 10 min is required). After curing the topcoat could be polished.

Basecoat

Basecoats are usually applied with gravity guns (gun tip 1.3-1.5 mm, pressure 2-4 bar) in 2-3 layers with flash-off between the layers at 20°C 10 min. It's strongly recommended to dry the basecoat completely before the application of the clearcoat to avoid the loss of adhesion.

Clearcoat

Acrylic clearcoats are usually applied with gravity guns (gun tip 1.3 – 1.5 mm, pressure 2 – 4 bar) in 1.5 – 2 layers. In case of 2 layer application the flash-off between layers should be made at 20°C for 10 min when the 1.5 layer application requires no flash-off between layers. The appearance of the topcoat could be predicted by the configuration of the gravity gun, spray viscosity of the clearcoat and by the characteristics of the environment.

Wet-on-wet application

Wet-on-wet is an application method which excludes the complete drying and sanding of the intermediate layers thus it saves the time and money. Wet-on-wet application implies strict requirements to the coatings quality. To obtain the high quality topcoat nearly no intermediate imperfections are allowed.

Wet-on-wet application with anticorrosive primer

This method must be applied when the refinishing part has areas of bare metal on it. At first, the anticorrosive primer should be applied and then surfacer and the topcoat.

Wet-on-wet application without anticorrosive primer

When the repaired part is fully covered with protective coating (means it has no bare metal areas) anticorrosive primer may not be used and application process will include only 2 stages: surfacer and topcoat.

Blending application

Often, this method helps to eliminate the color differences between the repaired part and the original, but also it could be used to decrease the repair costs.

Basecoat blending

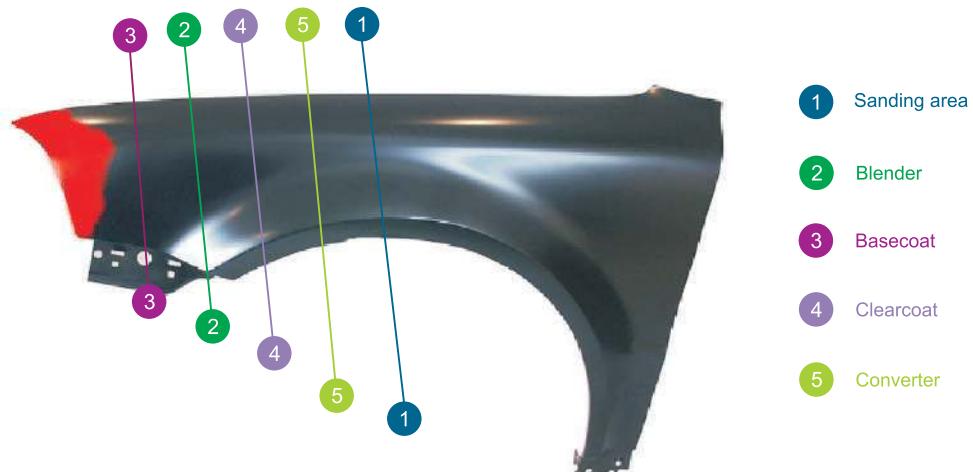

The surface must be properly pretreated before application. It should be dry sanded with P400-600 (or wet with P800-1000). To achieve the best results, sanding paste should be used and surface must be sanded thoroughly to avoid the adhesion defects. Then the surface must be degreased with Antisilicone and tacked.

The next step is to make a 'wet-bed', using the Blender to cover the whole overpainting surface in 1 layer. A little exposure time, and then the first layer of the basecoat should be applied on the repaired area. Flash off time between layers at 20°C 10 min. Each subsequent basecoat layer must overlap the previous. Once the basecoat is dry (approx. 15 min at 20°C) the clearcoat may be applied.

Clearcoat blending

When the clearcoat blending is necessary the Converter should be used for elimination of the edge-marking of the fresh clearcoat and the original. The surface must be painted with the clearcoat in 2 layers with flash-off between layers at 20°C 10 min. The Converter may be used either as a ready-to-use product or as a mix with the used clearcoat in 5:1 volume ratio. Converter should be applied in the blending area with reduced feeding and pressure. The drying of the clearcoat should be made in accordance with TDS for the used clearcoat. Then the blending area could be polished.

Blending application stages

Acrylic paint blending

The blending of the acrylic paint is the same process as the clearcoat blending, it requires the usage of Converter or its mix with the used acrylic paint in the blending area to eliminate the edge-markings. But the application of the acrylic paint should be made with overlapping of the layers to decrease the color differences.

Plastic surface treatment

Painting of the plastic part is not harder than the metal. The only thing that should be taken into account is that the bare plastic must be covered with Plastic Primer. As like the new metal spare parts have the protective coating, the new plastic spare parts may have it too. To check the quality of the protective coating the 'Solvent test' should be applied (see 'Surface check').

To treat the plastic spare part properly, at first, it must be degreased and then sanded with P400-600 or with the gray sanding pad, blown-off and degreased again. As stated above, all the areas of the bare plastic or when the spare part doesn't have the coating at all it should be covered with the Plastic Primer. Plastic Primer could be applied with the gravity gun or it is also available in very user-friendly spray can. The Plastic Primer should be applied in 1 thin layer (5-10 microns). Flash off-time is for 10 minutes at 20°C before the next coating application. When the surface has no imperfections, the topcoat could be applied directly on the Plastic Primer.

In case of repair of the plastic part, there's a range of special products to help with:

- Putty for bumpers, Putty with carbon fiber;
- Plastic Plus primer;
- Repair resin/Repair box.

The standard fillers-surfacers could be applied on plastics too, but it's the subject to their plasticizing using the Elastic Plus additive.

Attention! Please refer to the label and consult the technical data sheet for handling instructions. Don't use expired products or the mixes with expired pot-life. It's the buyers responsibility to check the information is up to date.

Polyester Stopper

RX F-05

Two-component Polyester Stopper with very high filling properties is intended for filling of the pores and of roughly pretreated large surfaces. Polyester Stopper should be applied with gravity gun. It has short drying time and forms easy-to-sand smooth coating.

EU/2004/42 Cat II B(c) VOC 190 g/l, VOC limit 540 g/l

Color: gray

Pack: 0.75 l

Substrates

Old paint coating - degrease, dry sand with P240 or with red sanding pad, degrease

Steel, aluminum, galvanized or stainless steel – degrease, dry sand with red sanding pad, degrease

Polyester putty – dry sand with P240, degrease

Do not apply on thermoplastic coatings!

Do not apply on self etching primers!

Mixing ratio

	Volume ratio, ml	Weight ratio, g
Polyester Stopper RX F-05	100	100
Hardener RX H-41	6.5	4

Do not dilute!

Application

Working pot life at 20°C 25-30 min

Nozzle diameter 1.8-3.0 mm

Pressure 2.0-4.0 bar

Number of layers 1-3

Thickness of dry single layer 200 microns

Temperature +15...+30 °C

Humidity ≤75 %

Drying times

Forced drying at 60°C 30 min

Air drying at 20°C 2 h

Infrared curing 10 min

Sanding

Dry sanding P150-240

Topcoats: self etching, epoxy or acrylic primers.

Shelf life 12 months

Putty Soft

RX S-02

Fine-grained polyester putty with high filling power allows to obtain the perfectly smooth surface. The Putty Soft is intended to eliminate the surface roughness and to create a smooth coating. Putty Soft builds easy-to-sand coating that allows quick surface leveling even for large areas.

EU/2004/42 Cat II B(b) VOC 120 g/l, VOC limit 250 g/l

Color: beige

Pack: 0.6 kg; 1 kg; 2 kg

Substrates

Old paint coating - degrease, dry sand with P240, degrease

Steel, aluminum, galvanized or stainless steel – degrease, dry sand with red sanding pad, degrease

EP Primer

RX P-03

Universal two-component primer is usually used as 2-in-1 anticorrosive primer and surfacer. EP Primer has an excellent adhesion to most types of surfaces.

EU/2004/42 Cat II B(c) VOC 520 g/l, VOC limit 540 g/l

Color: gray

Pack: 0.8l

Substrates

Old paint coating - degrease, dry sand with P240 or with red sanding pad, degrease

Polyester putty - dry sand with P240, degrease

Steel, aluminum, galvanized and stainless steel – degrease, dry sand with red sanding pad, degrease

Do not apply on thermoplastic coatings!

Do not apply on self etching primers!

Mixing ratio	Volume ratio, ml	Weight ratio, g
EP Primer RX P-03	100 . . .	100

Washprimer Spray

RX P-04

Washprimer Spray is 1K anticorrosive primer specially developed for spot repairs. Washprimer Spray should be used to cover bare metal areas to prevent corrosion processes and to increase adhesion of the topcoats. It could be directly overpainted with enamel or (when necessary) with filler-surfacer without sanding.

EU/2004/42 Cat II B(e) VOC 680 g/l, VOC limit 840 g/l

Color: gray

Nominal volume: 520 ml

To use UHS Primer Rapid 90 with this technique the amount of Acryl Thinner must be increased. Application should be made in 1 layer with 15 minutes flash-off at 20°C before overpainting.

UHS Primer Rapid 90

RX F-07

**Application on metal

The surface should be properly pretreated: degreased, sanded with red sanding pad and degreased again. To increase the corrosion resistance bare metal should be insulated with anticorrosive primer (Washprimer CFR X P-04/CF 1+1 RX P-02 or EP Primer RX P-03).

***Application on plastic

The surface should be properly pretreated: degreased, sanded with gray sanding pad and degreased again. For application of the UHS Primer Rapid 90 RX F-07 on plastic the primer should be used with 10 vol % of Elastic Plus RX N-11 additive. Amounts of hardener and thinner must be increased accordingly to the total volume of a mixture.

To increase the adhesion of the UHS Primer Rapid 90 RX F-07 to plastic surface it's strongly recommended to use the Plastic Primer RX P-05.

Acryl Thinner

RX T-01
RX T-02

Thinner for acrylic coatings is intended for dilution to spray viscosity of acrylic topcoats, primers. Available in two versions: standard and slow.

Acryl Thinner RX T-01

Recommended to use at an ambient temperature 20 - 25°C.

Pack: 0,5 l; 1 l; 5 l

Acryl Thinner slow RX T-02

Recommended to use when ambient temperature is higher than 25°C or when painting large surfaces.

Pack: 1 l; 5 l

Usage tips

Acryl Thinner should be added to the used product before application in recommended on label amount.

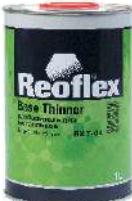

Shelf life 36 months

Base Thinner

RX T-03
RX T-04

Base Thinner is intended for dilution of the basecoats to spray viscosity.
Available in two versions.

Base Thinner RX T-04

Recommended to use at an ambient temperature 20 - 25°C.

Pack: 1 l; 5 l

Base Thinner slow RX T-03

Recommended to use when ambient temperature is higher than 25°C or when painting large surfaces.

Pack: 1 l; 5 l

Usage tips

Base Thinner should be added to the used product before application in recommended on label amount.

Shelf life 36 months

Acryl Activator

RX A-01

Acryl Activator is developed for acceleration of the curing of 2K acrylic primers, enamels and clearcoats.

Pack: 0.25 l

Usage tips

Acryl activator should be added to the used product in amount of 1%.

Addition of more than 1.5% is strictly prohibited.

Shelf life: 24 months

Test Cards

RX N-01

Test Cards are intended for the test-sprayings.

Test Cards are resistant to the thinners.

50 shits 100x70 mm

Antisilicone

RX N-02
RX N-10

Antisilicone fast RX N-02

It is recommended to use in conditions of low temperature (less than 20°C).

Pack: 1 l; 5 l

Antisilicone standart RX N-10

It is recommended to use when ambient temperature is higher than 25 °C.

Pack: 1 l; 5 l

Application

Antisilicone should be applied on the surface with cloth or spray. Dry with a towel without waiting for the evaporation.

Shelf life: 24 months

Glass Fiber Mat

RX N-05

Glass Fiber Mat is intended to use as enhancing material for repair of plastic parts, strengthening of the corroded metal, modelling of fiberglass products.

Density: 150 g/m²; 300 g/m²

Usage tips

Use with Repair Resin RX N-04.

Dry Coat

RX N-03

Dry coat is used as the sanding guide. Dry coat is thinners-free and easy to apply, does not stick to sandpaper. It is suitable for dry and wet sanding.

Color: white, orange, black

Pack: 50 g

Usage tips

Dry coat should be applied on the repaired surface with sponge (in a kit) before sanding.

Shelf life 24 months

Masking Film

RX N-08

Masking Film is intended to protect non-painted parts of the car body during the paint work. It can be widely used in protection of the surfaces from dust, dirt, paint, water and solvents not only in refinishing. Masking Film is an easy to use product with static properties and it is made of high-density polyethylene with the thickness of 7 microns.

Size: 4 x 5 m; 4 x 7 m

Converter

RX T-06

Converter is used for blending of the acrylic topcoats. The product is ready for application.

Pack: 0,5l

Substrates

Old paint coating— degrease, dry sand with gray sanding pad, degrease

Blender

RX T-05

Blender is developed for decreasing of the color differences between repaired and original parts when basecoat is used for application.

Pack: 0,5l

Old paint coating, primer-treated surfaces - degrease, dry sand with P500 or with gray sanding pad, degrease.

Application

Do not dilute!

Spray viscosity at 20°C	16-18 s
Nozzle diameter	1.3 mm
Pressure	2.0-4.0 atm
Number of layers	1
Recommended thickness	15 microns
Temperature,	+15...+30°C
Humidity	≤75%

Drying times

Flash-off at 20°C 3-5 minutes before basecoat application.

Shelf life 24 months

16-18"/20°C
Ready to use!

φ 1.3 mm
P = 2.0-4.0 bar
x1
15/20°C

Elastic Plus

RX N-11

Elastic Plus is a special additive for acrylic primers and clearcoats for application on plastics. Plasticized coatings have a long life flexibility.
Pack: 0.25l

Application

Elastic Plus should be added to acrylic primers and/or clearcoats in amount of 20 vol %. In case of wet-on-wet technique is used, the amount of Elastic Plus added to primer should be reduced in a half. The increasing of the total volume of the mix must be taken into account when the hardener and thinner amounts are calculated.

Shelf life 36 months

Disk Top Spray

RX E-02

One component topcoat spray is intended for painting of wheel rims. For extra protection of the surface Disk Top Spray should be overpainted with the clearcoat.

EU/2004/42 Cat II B(e) VOC 690 g/l, VOC limit 840 g/l

Color: khaki, silver, gray, black

Nominal volume: 520 ml

Substrates

Old paint coating - degrease, dry sand with P500, degrease

Steel, aluminum, galvanized and stainless steel – degrease, Washprimer CF RX P-04 or EP Primer RX P-03

Shake well before use!

Application

Distance	20-25 cm
Number of layers	2-3
Recommended thickness	30-40 microns
Temperature	+15...+30°C
Humidity	≤75%

Drying times

Air drying at 20°C 15-20 min

Topcoats: clearcoats.

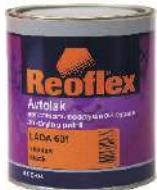

Shelf life 18 months

Avtolak is intended for painting passenger cars and commercial vehicles.
After drying coating can be polished if necessary.

Pack: 0,75 l

Substrates

Old paint coating, primer-treated surfaces - degrease, sand with P400-600, degrease

Mixing ratio

	Volume ratio, ml	Weight ratio, g
Avtolak RX E-04	100 . . .	100
Acryl Thinner RX T-01, RX T-02	30 . . .	27

Do not dilute with white spirit!

Application

Spray viscosity at 20°C	16-19 s
Nozzle diameter	1.3-1.5 mm
Pressure	2.0-4.0 bar
Number of layers	2
Recommended thickness	35-40 microns
Temperature	+15...+30°C
Humidity	≤75%

Drying times

Forced drying at 60°C	45 min
Air drying at 20°C	7 h

The final coating may be polished when necessary after 24 h drying.

Shelf life 24 months

16-19"/20°C
RX T-01, RX T-02

Acryl Top

RX E-03

Two-component acryl topcoat is intended for the final painting of metal and plastic parts. Acryl topcoat presented by ready-to-use colors and COLOR MIX SYSTEM. After drying coating can be polished if necessary.

Pack: 0.8 kg; 1 l; 3.5 l

Substrates

Old paint coating, primer-treated surfaces - degrease, dry sand with P500, degrease

Mixing ratio 4:1

	Volume ratio, ml	Weight ratio, g

Base Coat

RX B-01

Base coat is intended for creation of decorative coatings for metal and plastic car parts in combination with the clearcoat. Base coat is presented by ready-to-use colors and components.

Pack: 1 l; 3.5 l

Substrates

Old paint coating, primer-treated surfaces - degrease, dry sand with P500, degrease

Mixing ratio	Volume ratio, ml	Weight ratio, g
Base Coat RX B-01	100	100
Base Thinner RXT-03, RXT-04	50-60	46-55

Application

Spray viscosity at 20°C	15-18 s
Nozzle diameter	1.3-1.5 mm
Pressure	2.0-4.0 bar
Number of layers	2-3
Recommended thickness	20-30 microns
Temperature	+15...+30 °C
Humidity	≤75%

Drying times

Flash-off at 20°C 15-20 minutes before clearcoat application.

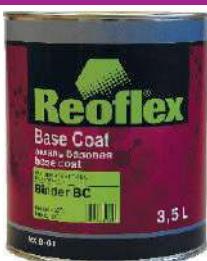

Topcoats: clearcoats.

Shelf life 24 months

Binder BC

RX B-01

Binder BC is a colorless basecoat that is used for creation of the tri-coat topcoats. Also Binder BC may be used as color blender.

Pack: 3.5 l

Shelf life 24 months

Bumper paint

reoflex.ru

Bumper Paint is intended for repair of bumpers, mouldings, side view mirror housings and other plastic parts. Bumper Paint is a 1K topcoat that has a shortened drying time, excellent adhesion to most types of plastic surfaces, good flexibility, stone chipping and environmental resistance.
